Cyber security

► Cyber security web applications

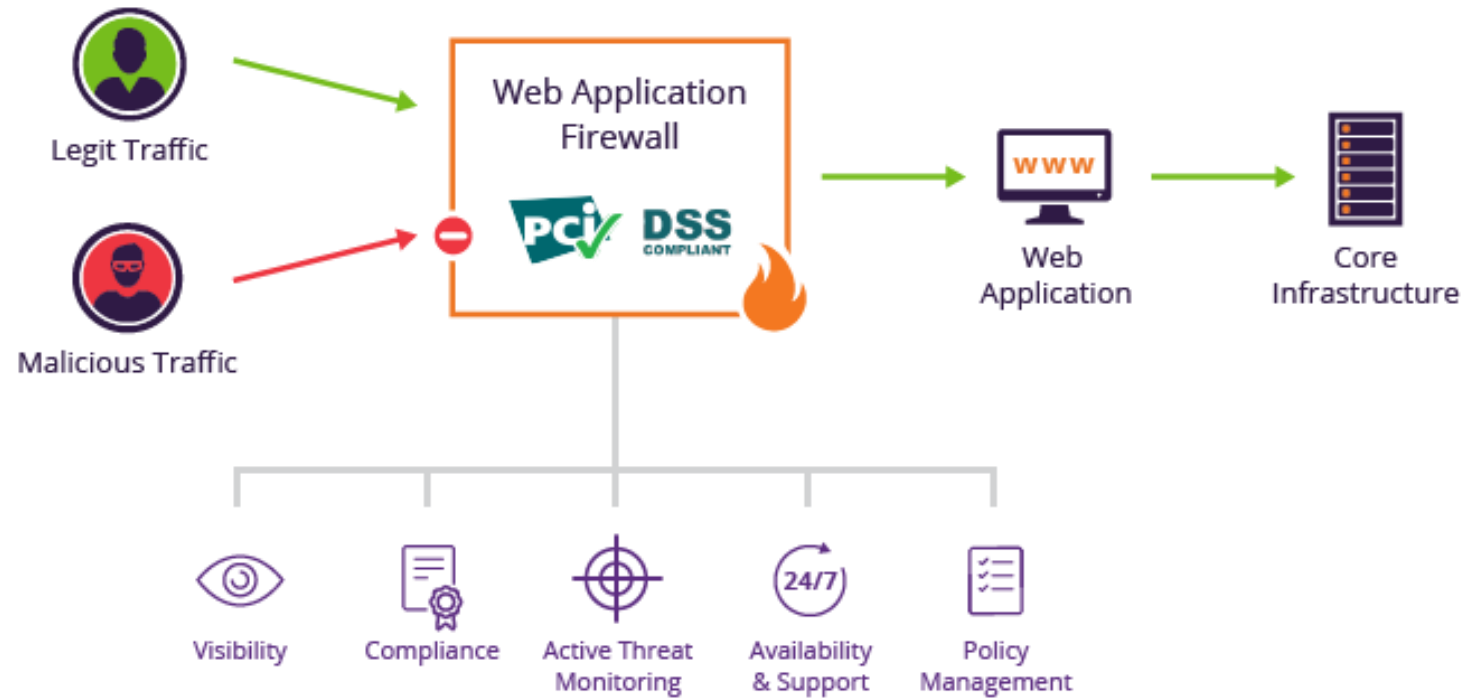

Outline

- ✦ Cyber security web applications Define
- ✦ applications architecture
- ✦ request
- ✦ response
- ✦ applications
- ✦ Source code.
- ✦ output
- ✦ Conclusion

Cyber Severity web applications Define

- ▶ **Web Applications are integral to almost everything we do, whether it is to access the Internet or to remotely control your lawnmower. In this introduction class we will cover the basics of web application security**

Web applications architecture

Web Application Security

www.educba.com

The HTTP protocol

HTTP is the carrier protocol which allows our browsers and applications to receive content such as HTML ("Hyper Text Markup Language"), CSS ("Cascading Style Sheets"), images and videos.

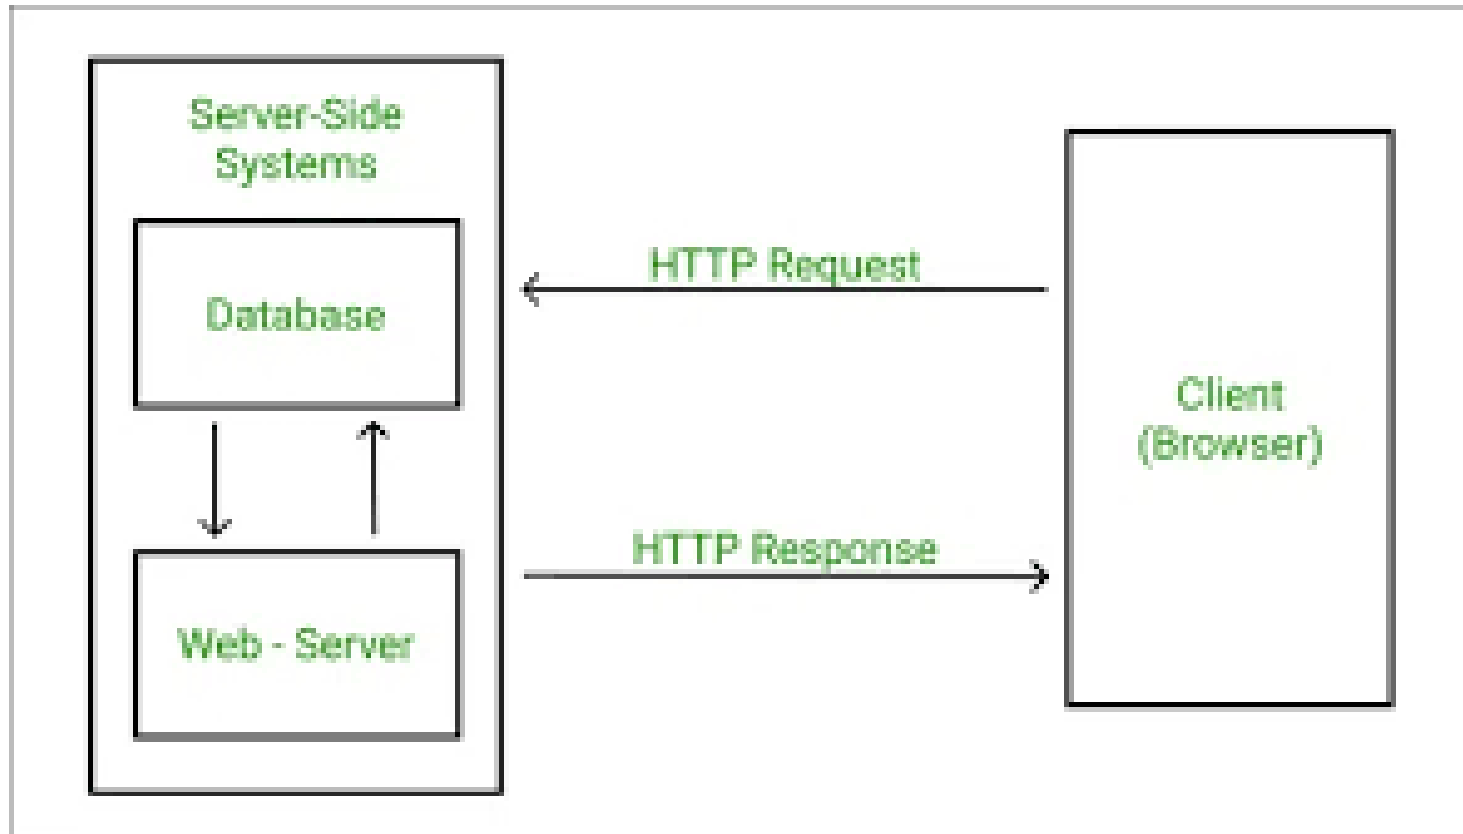

Protocols

- ▶ **The Scheme is what defined the protocol to use. In our case it is the first part of the URL: https. When the scheme is not defined in the URL it allows the application to decide what to use. Schemes can include an entire array of protocols such as:**
- ▶ **HTTP**
- ▶ **HTTPS**
- ▶ **FTP**
- ▶ **SSH**
- ▶ **SMB**

HTTP REQUEST

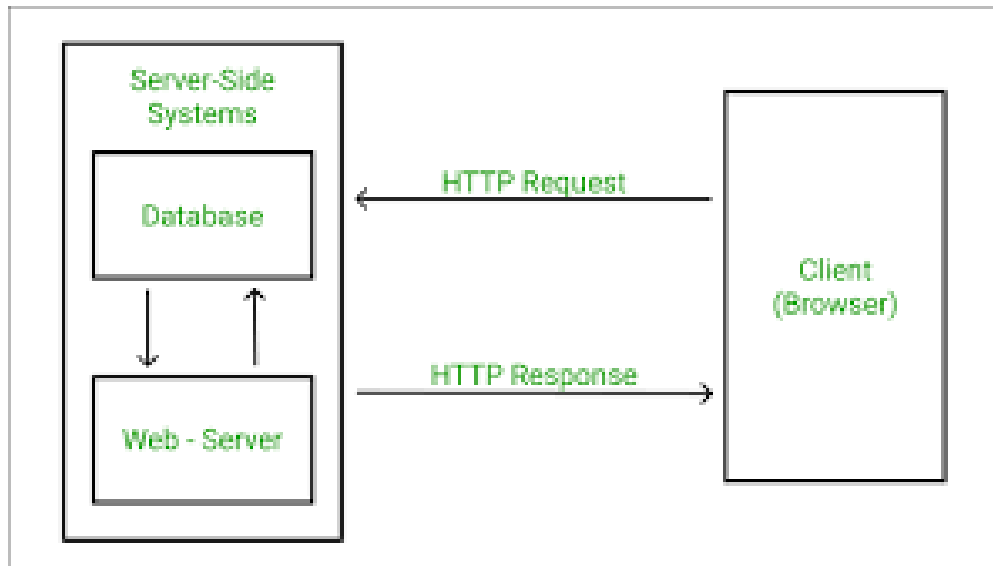

- ▶ **Get**
- ▶ **Put**
- ▶ **Post**
- ▶ **Delete**
- ▶ **Update**
- ▶ **Read**
- ▶ **Write**

- ▶ HTTP (Hypertext Transfer Protocol), is the underlying format that is used to structure request and responses for effective communication between a client and a server. **The message that is sent by a client to a server is what is known as an HTTP request.**

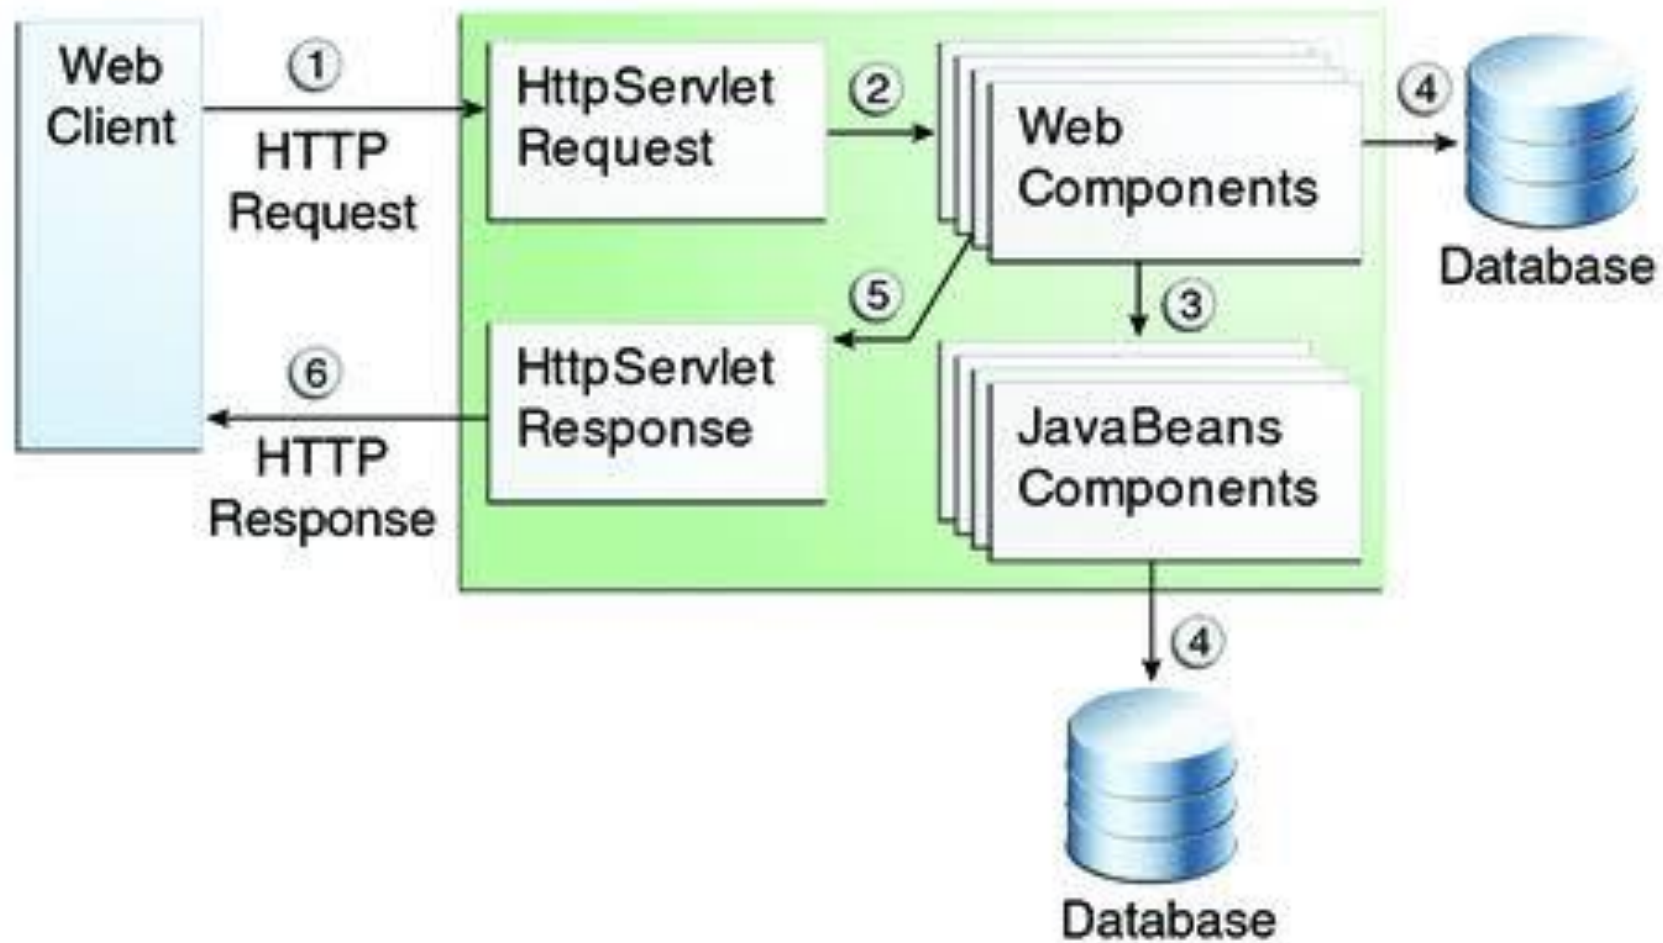

HTTP RESPONSE

- An HTTP response has both a header and a body. The header info tells the browser about the protocol being used, whether the request was successful, and what kind of content is included in the body. The body contains the contents (for example, HTML) for the browser to display.

Client to sever

Source code

```
▶ from flask import Flask, jsonify, request
▶
▶ app = Flask(__name__)
▶
▶
▶ @app.route('/hello', methods=['GET'])
▶ def helloworld():
▶     if(request.method == 'GET'):
▶         data = {"data": "Hello World"}
▶         return jsonify(data)
▶
▶
▶ if __name__ == '__main__':
▶     app.run(debug=True)
```

Output⁺

Output :

```
{  
  "data": "Hello World"  
}
```

Conclusion:

web application security is a major part of modern organizational risk management. Web applications are more at risk now than ever before, so executives and managers must take the right steps necessary to secure their web applications against new threats.
